

Case Study - Conservation Effects

| Type of Operation and Location: Cropland, Preble County, Ohio   |  |  |  |
|---|--|--|--|
| <b>Resource Setting:</b><br>Moderately sloping (3-6%) Corwin, Miami, and Celina soils   | <b>Resource Problem(s):</b><br>Moderate sheet and rill erosion, gully erosion, nutrient and pesticide runoff   | <b>Benchmark System:</b><br>Conventional till corn and soybeans, no soil testing, excessive use of pesticides, no grass waterways.   |  |
| <b>Client Objective(s):</b><br>Reduce erosion, maintain and improve yields, farm more efficiently.  |  | <b>Planned Treatment System:</b> <ul style="list-style-type: none"><li>Conservation Crop Rotation ; No Till; Nutrient Management; Pest Management; Grassed Waterways</li></ul> Meets Resource Management System Criteria   |  |
| Comparison of Effects of Benchmark and Treatment Option   |  |  |  |
| Actions Before Treatment<br>(Kinds, Amounts, Timing of the benchmark system)  | Effects Before Treatment<br>(Effects of continuing the benchmark system)   | Impacts After Treatment<br>(Change from the before treatment to the applied treatment)   | Decisionmaker Evaluation<br>(+) Feels Positive about the change<br>(-) Feels a drawback about change   |
| Corn: <ul style="list-style-type: none"><li>- Apply row starter N,P,K</li><li>- Spring Broadcast K</li><li>- Sidedress Liquid N</li><li>- Three tillage passes prior to planting</li><li>- Apply pre-emerge herbicide after planting</li><li>- One rotary hoe operation</li><li>- Post emerge herbicide</li></ul> Soybeans: <ul style="list-style-type: none"><li>- Three tillage passes prior to planting</li><li>- Plant 30 rows with starter P &amp; K</li><li>- Fall broadcast K</li><li>- Apply Pre-emerge herbicide after planting</li><li>- 2 row cultivations</li><li>- Apply Post-emerge herbicide</li></ul> Gullies: Disk annually<br><br>Fertilizer: <ul style="list-style-type: none"><li>-Not field specific - use what always used.</li></ul> | <ul style="list-style-type: none"><li>• Soil loss avg 9 tons/ac/yr</li><li>• Sediment, nutrients, pesticides moving off in surface runoff</li><li>• Gullies becoming more defined and deeper.</li><li>• Average 5+ gallons of fuel per acre</li><li>• Average 2 hours per acre</li><li>• Need hired labor for tillage</li><li>• Yields are difficult to maintain</li></ul> | <ul style="list-style-type: none"><li>• 7 tons/ac/yr of soil saved</li><li>• Nutrient, pesticide, and sediment runoff is minimized</li><li>• Gully erosion is eliminated.</li><li>• Less equipment and equipment maintenance</li><li>• Easier planting and harvesting conditions</li><li>• Yields are increasing</li><li>• No hired labor needed</li><li>• Average .75 hours/acre</li><li>• Average 1 gallon of fuel per acre</li><li>• Nitrogen reduced by 15%</li><li>• P &amp; K needs reduced by 50%</li><li>• Pesticide amount and cost reduced 15%</li><li>• 3 less trips across the field</li><li>• Soybeans solid seeded</li></ul> | <ul style="list-style-type: none"><li>• (+) Water quality improved with less sediment, nutrients, and pesticides.</li><li>• (+)</li><li>• (+) less wear and tear on equipment (-) loss of cropland</li><li>• (+) saves time and money</li><li>• (+) less stress, less soil compaction</li><li>• (+)</li><li>• (+) Saves \$3000 per year</li><li>• (+) Reduced need for hire labor</li><li>• (+) Saved money</li><li>• (+) Saved money &amp; better yield</li><li>• (+) Saved money &amp; better yield</li><li>• (+) Saved money &amp; good weed control</li><li>• (+) Save time and money</li><li>• (+) increased yield and better weed control; (-) purchased new no till drill</li></ul> |
